PIZZA SALES DASHBOARD

Project Documentation | Microsoft Excel

Project overview

This project presents pizza sales data in an interactive Excel dashboard. It is designed to summarize sales performance, compare pizza-size/category contributions, and explore monthly sales and order-volume trends.

Metric	Value	Definition
Total Sales	817,860.05	Sum of order-detail sales values; currency not confirmed
Unique Orders	21,350	Distinct order IDs in the orders table
Order-detail rows	48,620	Number of line-item records in order_details

1. Project Objectives

- Track overall sales and order volume.
- Compare sales distribution across pizza sizes/categories.
- Review monthly sales and order-count patterns.
- Provide an interactive month filter for focused exploration.

2. Data Sources and Workbook Structure

The Excel workbook includes the core source sheets `pizza_types`, `pizzas`, `order_details`, and `orders`, along with summary/export sheets and the dashboard sheet `Sheet1`.

Sheet	Purpose
pizza_types	Pizza names, categories, and ingredient descriptions
pizzas	Pizza IDs, type IDs, sizes, and prices
order_details	Order line items, quantities, pizza attributes, and sales values
orders	Order IDs, dates, times, hour, and month fields
Sheet3	Summary tables supporting dashboard analysis
Sheet1	Dashboard canvas with KPI cards and charts

3. Methodology and Steps

Data understanding: Reviewed the tables and identified fields relevant to sales, orders, pizza size, date, and month.

Data preparation: Used the available identifiers and descriptive fields to support analysis across orders, pizza types, prices, and line items.

Summarization: Prepared summary tables for sales by pizza size/category and monthly sales/order counts.

Visualization: Created a pie chart, doughnut chart, line chart, and horizontal bar chart to make comparisons easier.

Interactivity: Added a month slicer/filter to allow month-based exploration where supported by Excel.

Dashboard design: Placed KPI cards and charts on one dashboard canvas and applied consistent colors, labels, and formatting.

4. Dashboard Components

Component	Purpose
Total Sales by Pizza Slice	Shows how sales are distributed across pizza-size/category labels used in the workbook.
Order Count by Pizza Size	Compares order-count values by pizza size; verify PivotTable aggregation before interpreting category value
Total Sales Monthly	Shows the change in sales across months.
Total Count by Month	Compares monthly order-volume counts.
KPI cards	Highlights the workbook's overall sales and count metrics.
Month slicer	Filters dashboard views by month when slicer connections are configured.

5. Tools and Skills Demonstrated

Microsoft Excel; data inspection and preparation; summary tables/PivotTables; charts; slicers; KPI cards; data visualization; dashboard layout; and sales analysis.

6. How to Open and Use the Project

- Open `data/pizza_sales_dashboard.xlsx` in Microsoft Excel desktop.
- Select the `Sheet1` tab to view the dashboard.
- Use the month slicer to explore a month, and inspect source and summary sheets as needed.
- If the slicer or charts do not respond, check slicer connections and refresh the workbook's data/pivot summaries in Excel.

7. Validation Notes and Limitations

- The workbook's total sales sum is 817,860.05. The currency is not confirmed by the workbook.
- The source orders table contains 21,350 order records. Confirm the dashboard's “Total Count” label and aggregation definition before reporting it as an order count.
- The workbook's size/category chart values should be checked against the underlying summary tables before drawing business conclusions.
- If the dataset originated from a third-party source, include the original source and required attribution in the repository.

8. Suggested Future Improvements

- Rename generic columns in `pizza_types` to descriptive names.
- Add explicit currency formatting and clear metric definitions.
- Validate all PivotTable calculations and slicer connections.
- Add insights such as best-performing month, top pizza types, and average order value.
